

AI Wardrobe Stylist - PRD

Product Overview

AI Wardrobe Stylist is a web application that helps users organize clothing, generate outfits, and receive AI styling suggestions based on wardrobe metadata.

Problem Statement

Users struggle to organize outfits, forget clothing items, and waste time deciding what to wear. Existing solutions are either too manual or too complex.

Goals

Primary: wardrobe management, outfit generation, favorites system. Secondary: AI explanations and future virtual try-on.

Core Features

1. Wardrobe Management: upload items with metadata (category, color, style, season).
2. Outfit Generator: AI suggests outfits based on occasion and weather.
3. Favorites: save and manage outfit combinations.
4. AI Styling Explanation: LLM explains outfit choices.

System Architecture

Frontend: Next.js + TypeScript + Tailwind + Zustand

Backend: FastAPI (Python)

Database: PostgreSQL (Supabase recommended)

AI: Groq / Gemini for LLM, IDM-VTON for future try-on

Data Models

ClothingItem: id, userId, imageUrl, category, color, style, season, createdAt

Outfit: id, userId, items[], occasion, weather, createdAt

MVP Scope

Must-have: wardrobe upload, metadata tagging, outfit generation, favorites

Nice-to-have: AI explanations, calendar planning

Future: virtual try-on with IDM-VTON

Roadmap

Phase 1: MVP build

Phase 2: AI improvements

Phase 3: Virtual try-on integration
